

An accurate and current reflection of the technical assets of an enterprise is imperative to reliable technology management. A configuration management database (CMDB) is the foundation of that view. Databases of technical inventories and configurations are rarely perfect. Without consistent attention they typically become stale and inaccurate. Managing healthy infrastructure requires a current and accurate repository of assets and configurations as well as an understanding of the entity relationships. Enterprise service management has grown overtime which has required multiple different tools to accomplish the results. These tools are often specialized and only contain pieces of the overall picture.

TFORM puts the puzzle together by allowing you to reconcile the various tools to get a complete picture

How we do it

Enterprise Asset Discovery

- Agentless, organic discovery of assets, applications & vulnerabilities
- Holistically visualize complex hybrid IT Ecosystems
- Automated aggregation of data from disparate toolsets to tell one story

Reconciliation

- Compare multiple disparate data sources and highlight differences with the organically discovered data
- Using TFORM's reconciliation dashboard view and reconcile the data in a central location

Exception Reporting & Update

- Exception reporting provided through API, CSV or other required formats
- Reconciled information provided to the IT teams for remediation
- Bi-directionally update existing tools using TFORM's continuous discovery and reconciliation capabilities

Full Visibility

Visualize your entire IT landscape under a single dashboard. Rely on robust automation to reconcile your IT ecosystem without using Excel spreadsheets.

Tip of the iceberg

Most tools only show you one view of the data. Allow TFORM to show you, your entire IT ecosystem.

C-Suite Views

TFORM visualizes data that you and your C-Suite care about. Expose missing and inaccurate data in your IT landscape. Allow your IT team to be the source of truth.

An intelligent analytic source of truth for hybrid IT management

TFORM™ is a Hybrid Enterprise IT Analytics software, providing the level of detail that technology leaders require. TFORM offers the most detailed insights needed for transitions, transformations, and trending IT data points. TFORM understands dependencies within the IT enterprise, including on-premise data centers, cloud, and their respective applications. TFORM supports IT Service Management processes and systems by integrating bi-directionally the various systems that empower leaders to make well informed decisions.
